Reaction-diffusion modelling of hydrogen retention and release mechanisms in beryllium

Mirko Wensing
 Reaction-diffusion modelling of hydrogen retention and release mechanisms in beryllium

Mirko Wensing
# Contents

1. **Introduction**  
   1.1. Thermonuclear fusion  
   1.2. Thermal desorption spectroscopy  
   1.3. Experimental observations:  
      1.3.1. Low fluence regime  
      1.3.2. Retention near critical fluence  
      1.3.3. Very high fluence-regime  
   1.4. Rate equation modelling  
   1.5. Aim of this thesis  

2. **Hydrogen diffusion in beryllium**  
   2.1. Diffusion in solids  
   2.2. Beryllium: Atomistic properties  
   2.3. Atomistic description of diffusion  
   2.4. Monte Carlo model  
   2.5. Diffusion with temperature ramp  
      2.5.1. Analytical solution  
      2.5.2. Comparison to numerical solutions  
   2.6. Conclusion  

3. **Binding mechanisms of H in defects**  
   3.1. Environment of vacancies  
   3.2. Vacancy-hydrogen complex  
   3.3. From first-principles to rate-equation modelling  
      3.3.1. Detrapping: \( \text{VH} \rightarrow \text{H} + \text{V} \)  
      3.3.2. Trapping: \( \text{H} + \text{V} \rightarrow \text{VH} \)  
   3.4. Simple CRDS  
   3.5. Mobile defects  
   3.6. Ambiguities in earlier CRDS calculations  
   3.7. Multiple trapping  
   3.8. Comparison to experimental data for low fluences  
   3.9. Conclusion  

4. **Surface effects**  
   4.1. Desorption from Be(0001)-surface  
   4.2. Analytic treatment of second order desorption processes
Reaction-diffusion modelling of hydrogen retention and release mechanisms in beryllium
